

I have enough interference from the power line company on HF frequencies (and line voltage problems too) as it is now. Surely, do not allow them to radiate more interference that will cause nothing but grief for other usable frequency spectrums. They (the power line companies) cannot properly control their spurious spark gap transmitters now, (line noise, line fluctuations, excessive voltage, sag, brown outs and black outs etc..) let alone giving them room to generate more spurious signals that would definately interfere with the high frequency spectrum. I have monitored their service thru data logging and have am not impressed with their lack of responsiveness to issues that have caused me significant and expensive equipment failures. To use their service I have to rely on Battery back up equipment and expensive filtering to make the power line voltage usable on my computer equipment as an example. Their response is well just turn it into your insurance company.

No attitudes like that are now in the best interest of the public. Do not open this opportunity to them because they cannot handle the 60 hz power distribution satisfactorily. I certainly do not want to see them in the Radio frequency business.
